## **Dialysis-Related Amyloidosis: International Symposium, Nagoya, May 1994 (Contributions to Nephrology, Vol. 112)**

Dialysis-related amyloidosis is a frequent complication encountered in patients receiving long-term haemodialysis. This book presents evidence on the possible role of beta2-microglobulin modified with advanced glycation end products (AGE) in the pathogenesis of the disease. The first of the three sections investigates the structure of AGE-modified protein, its formation mechanisms and its biological activity. The book reveals that AGE-modified beta2-microglobulin has a chemotactic effect on monocytes, and stimulates macrophages to secrete interleukin 1beta, interleukin 6 and TNFalpha. In other sections, the factors causing dialysis related amyloidosis are examined and the effectiveness of various haemo-purification methods in alleviating osteoarthropathy are assessed.
