Continuing to keep pace with progress in human molecular genetics, Volume 4 of **Molecular Genetic Medicine** reviews five new areas of critical importance. Chapter 1 reviews the molecular mechanisms that have been unraveled in the pathogenesis of eye diseases. The second chapter explains the remarkable new principle of genomic imprinting, or epigenetic modification imposed by parental history. Chapter 3 describes the etiology of amyotrophic lateral sclerosis, or Lou Gehrig's Disease, as effected by superoxide dismutase function and neuron degeneration. The fourth chapter covers the normal and aberrant functions of peroxisomes, now implicated in many diseases, most notably adrenoleukodystrophy, publicized widely by the "cure" called Lorenzo's oil. The final chapter summarizes recombination techniques that permit functional new genetic material to be introduced into, and subsequently transmitted through, the germ line of mammalian cells. These amazing methods are having profound impacts on medicine and on concepts of the study of normal human development and disease.

Presents technical and historical overviews of molecular biology applied to disease detection, diagnosis, and treatment

Chronicles the continuing explosion of knowledge in molecular genetic medicine giving current approaches to understanding human illness

Documents the revolution in human and molecular genetics leading to a new field of medicine
